

# PARENTS' MIGRANT STATUS

---

Barbara Castillo Rico

The goal of this document is to explain the process of creation of the variables mother's migrant status and father's migrant status.

The construction of these two variables is developed in 3 steps: identification of birth place and nationality of each family member, imputation of missing values and creation of parents' migrant status variable. In this document we present, as example, the code for parental family at 2 months, but exactly the same process is developed for the maternal family members. The full STATA code at 2 months is at the end of the document.

In the ELFE mini-site you can find two different migration status imputation codes: *2 months* and *1 year*. In the *2 months* code, we just use information from the 2 months wave to develop the process; while both 2 months and 1 year waves are used in the *1 year* code.

## 1. RESTRICTION OF THE SAMPLE

First of all, we recommend you to take into account the population of interest in your analysis. It could simplify the proposed imputation since you may get zero missing values in your variables quicker than working with the full sample. Then, you would not apply the full code proposed in this document. However, you should not restrict the sample before imputation since it could bias the random generation of binomial distributions which takes place in the imputation. As a consequence, you should check the result of missing values as follows:

```
tab fbirthfr fnationfr if RESTRICTIVE_VARIABLE==1, missing
```

We restrict our sample in order to keep all children included in maternity and 2 months, either with a completed or a partially completed questionnaire. We decided to keep both completed and partially completed in order to get the maximum number of observations with information. Partially completed questionnaires represent 887 observations in the sample, and most of them have information on the variables of interest.

**However**, notice that individual weights proposed by the Elfe team are computed just for children with a fully completed questionnaire. Then, observations of babies with partially completed questionnaires do not have a weight in the dataset. In order to get only individuals with weights, you should modify your restriction condition.

```
//1. Children for which we have data in 2months wave  
g months2 = 1 if inlist(M02X_QMERECOMP2M,1,2) & inlist(M02X_TYPQMERE2M,1,2,3) //completed and partially completed, mother referent
```

```

replace months2 = 1 if inlist(M02X_QPECFCOMP2M,1,2) & inlist(M02X_TYPQPECF2M,1,2) //completed and partially completed, father referent
replace months2 = 0 if missing(months2)
label var months2 "The elfe child is in the 2months wave"
label define months2 1 "Yes" 0 "No"
tab months2
tab months2 if M02X_QMERECOMP2M==2 | M02X_QPECFCOMP2M==2

```

Then, we will work with a 16567 observations sample of children both included in maternity and 2 months. Moreover, we propose a new variable which identifies unknown fathers in order to avoid imputation efforts on this group. We consider as unknown fathers all fathers who are not in the baby's household, who did not answer the father's questionnaire and who did not recognized his child. Also, this variable allows us to account for this type of situation in future analysis.

```

//2. WE NEED TO IDENTIFY FATHERS WHO ARE NOT PRESENT IN CHILDS LIFE, OR AT //
//LEAST WE DO NOT HAVE ANY INFORMATION ABOUT THEM.

```

\* The father recognized the child  
g father\_recogn\_child=.  
replace father\_recogn\_child = 1 if M00M2\_ETATMAT==1 & M00M2\_COUPLE==1  
replace father\_recogn\_child = 1 if M00M2\_RECONU==1 & father\_recogn\_child==.  
replace father\_recogn\_child = 1 if M02M\_RECON==1 & father\_recogn\_child==.  
replace father\_recogn\_child = 0 if M00M2\_RECONU==0 & father\_recogn\_child==.  
replace father\_recogn\_child = 0 if M02M\_RECON==2 & father\_recogn\_child==.

```

label var father_recogn_child "Father has recognized the child, 2 months"
label define father_recogn_child 0 "No" 1 "Yes"
tab father_recogn_child, missing

```

\* The baby lives with the mother and the father is not in the household.  
g child\_hhld = 1 if M02M\_EFVIT==1  
replace child\_hhld = 2 if M02M\_EFVIT==2  
replace child\_hhld = 3 if M02M\_EFVIT==3  
replace child\_hhld = 4 if M02M\_EFVIT==4  
replace child\_hhld = 5 if M02M\_EFVIT==5  
replace child\_hhld = 6 if inlist(M02M\_EFVIT,6,7)

```

replace child_hhld = 6 if M02X_TYPQMERE2M==3 & missing(child_hhld)
replace child_hhld = 5 if M02X_TYPQMERE2M==4 & missing(child_hhld)

```

```

replace child_hhld = 3 if M02X_TYPQPECF2M==3 & missing(child_hhld)
replace child_hhld = 6 if M02X_TYPQPECF2M==5 & missing(child_hhld)
replace child_hhld = 5 if M02X_TYPQPECF2M==6 & missing(child_hhld)
replace child_hhld = 2 if M02X_TYPQPECF2M==7 & missing(child_hhld)
replace child_hhld = 6 if M02X_TYPQPECF2M==8 & missing(child_hhld)
replace child_hhld = 5 if M02X_TYPQPECF2M==9 & missing(child_hhld)

```

```

replace child_hhld = 1 if M02M_LIENTYP_4==1 & missing(child_hhld)
replace child_hhld = 2 if !inlist(M02M_LIENTYP_4,1) & missing(child_hhld)

```

```

label var child_hhld "person living with the child, 2 months"
label define child_hhld 1 "both father and mother" 2 "mother" 3 "father" 4 ///
"rotating custody" 5 "placed child" 6 "at the hospital"
tab child_hhld, missing

```

```

**if father is not in the household, the father did not recognize the child and he did not answer the questionnaire:
g f_unknown = 1 if child_hhld==2 & !inlist(M02P_LIENTYP_4,1) & ///
father_recogn_child==0
replace f_unknown = 1 if inlist(M02M_INFPER,2,3,4) & f_unknown==.
replace f_unknown = 0 if f_unknown==.

lab var f_unknown "The father is unknown for us"
lab define f_unknown 1 "Yes" 0 "No"
tab f_unknown, missing
tab f_unknown if months2==1, missing

```

There are 346 babies with an unknown father in our restricted sample (2 months).

## 2. BIRTH PLACE AND NATIONALITY VARIABLES

In this stage, we identify the birth place and nationality of each family member: father, paternal grandmother and paternal grandfather. In order to do that, we use all available information in the Elfe data set (maternity and 2 months). These variables are needed to construct the final migration status. Moreover, we identified the main language of each member, which will be used latter on the imputation.

```

Thus, we identified information on birth place, nationality and main language for each family member:

Birth place:

fbirthfr, f\_gmbirthfr, f\_gfbirthfr

Nationality:

fnationfr, f\_gmnationfr, f\_gfnationfr

Language:

fleng, f\_gmleng, f\_gfleng

### 3. IMPUTATION OF MISSING VALUES

After the identification of the main variables used in the construction of parents' migration status, we find numerous missing observations in birth place and nationality of all members, but mainly in all grandparents. This issue could make very difficult the identification of parents' immigrant status as first or second generation immigrants. As a consequence, we need to impute the maximum number of missing values from other strongly related variables.

#### 3.1. LANGUAGE

The main language is considered as a potential indicator about the migrant status, and can be used to impute missing values. In the previous step, we identified the main language spoken by each member of the family and we now suppose that individuals who spoke a foreign language at home have a higher probability to have a foreign nationality and birth place, or to be second generation immigrants. Thus, we will use this variable to impute the missing values of nationality and birth place of each family member.

Then, we propose to use the distribution of nationality (French or foreign) within the population who speaks a foreign language at home, as the probability to be on each nationality category for foreign language speakers. For example, within foreign language speakers, 93% of population has a foreign nationality, while 7% of population has French nationality. Then, we will randomly generate the same binomial distribution on missing observations, using proportions as the probability to be assigned to each category.

The same method is applied for foreign speakers and French speakers, both for nationality and birth place. Finally, we will generate a random binomial distribution of birth place and nationality to all missing values for which we have information on the main language. This method is applied to all family members (father, parental grandmother and parental grandfather).

```
//4. IMPUTATIONS OF FATHER' FAMILY -> LANGUAGE

tab f_gmleng f_gmnationfr, missing

//4.3. GRANDFATHER FATHER
tab f_gfleng f_gfbirthfr, missing
tab f_gfleng f_gfbirthfr
replace f_gfbirthfr = rbinomial(1, 0.171) if f_gfleng==0 & f_gfbirthfr==.
replace f_gfbirthfr = rbinomial(1, 0.882) if f_gfleng==1 & f_gfbirthfr==.
tab f_gfleng f_gfbirthfr, missing

tab f_gfleng f_gfnationfr, missing
tab f_gfleng f_gfnationfr
replace f_gfnationfr = rbinomial(1, 0.193) if f_gfleng==0 & f_gfnationfr==.
replace f_gfnationfr = rbinomial(1, 0.923) if f_gfleng==1 & f_gfnationfr==.
tab f_gfleng f_gfnationfr, missing
```

### 3.2. OTHER FAMILY MEMBERS' INFORMATION

After reducing the total number of missing values for each family member using the language spoken at home, we still have several missing values for all of them.

The available information regarding nationality and birth place of grandparents could give us some information about their son's nationality, and vice versa. Thus, we are able to identify some statuses:

- If at least one grandparent has French nationality, their son had French nationality at birth.
- If both grandparents have foreign nationality, their son had foreign nationality at birth.

```
//5. IMPUTATIONS FATHER' FAMILY -> OTHER MEMBERS' INFO
```

```
//5.1. From grandparents' information, FATHER  
g f_parents = 1 if f_gfnationfr==1 | f_gmnationfr==1  
replace f_parents = 0 if f_gfnationfr==0 & f_gmnationfr==0  
label var f_parents "At least one grandparent has french nationality, father"  
label define f_parents 1 "Yes" 0 "No"
```

```
tab fbirthfr fnationfr, missing  
replace fnationfr = 1 if f_parents==1 & fnationfr==.  
replace fnationfr = 0 if f_parents==0 & fnationfr==.  
tab fbirthfr fnationfr, missing
```

Moreover, we can impute some information of grandparents using father's and couple information.

- If the father had foreign nationality at birth, both parents should have foreign nationality.
- If the father had French nationality at birth and the grandfather has foreign nationality, then, the grandmother has French nationality.
- If the father had French nationality at birth and the grandmother has foreign nationality, then, the grandfather has French nationality.

```
//7. IMPUTATIONS FATHER' FAMILY -> OTHER MEMBERS' INFO
```

```
//7.1. From father nationality, GRANDMOTHER FATHER  
tab f_gmbirthfr f_gmnationfr, missing  
replace f_gmnationfr = 0 if fnationfr==0 & f_gmnationfr==.  
replace f_gmnationfr = 1 if fnationfr==1 & f_gfnationfr==0 & f_gmnationfr==.  
tab f_gmbirthfr f_gmnationfr, missing
```

```
//7.2. From father nationality, GRANDFATHER FATHER  
tab f_gfbirthfr f_gfnationfr, missing  
replace f_gfnationfr = 0 if fnationfr==0 & f_gfnationfr==.  
replace f_gfnationfr = 1 if fnationfr==1 & f_gmnationfr==0 & f_gfnationfr==.  
tab f_gfbirthfr f_gfnationfr, missing
```

### 3.3. OWN BIRTH PLACE AND NATIONALITY

After using language and family member's information, we still have missing values. The last source of information to impute missing values on birth place and nationality are these variables by

themselves. We suppose that the nationality is highly related with the birth place and vice versa. Thus, we propose to use the same method proposed in 3.1.

Hence, we use the distribution of nationality (French or foreign) within the group of individuals of the sample who is born abroad, as the probability to be on each nationality category for born abroad individuals. For instance, 99% of fathers born in France have French nationality, while 1% has foreign nationality. As a consequence, we will randomly assign nationality missing values of individuals born in France into a binomial distribution with probability 0,99 and 0,01.

The same process is developed for both nationality and birth place as follows:

```
//6. IMPUTATIONS FATHER' FAMILY -> OWN BIRTH PLACE AND NATIONALITY
//6.1. FATHER
tab fbirthfr fnationfr, missing
tab fbirthfr fnationfr
replace fbirthfr = rbinomial(1, 0.05) if fnationfr==0 & fbirthfr==.
replace fbirthfr = rbinomial(1, 0.983) if fnationfr==1 & fbirthfr==.
replace fnationfr = rbinomial(1, 0.099) if fnationfr==. & fbirthfr==0
replace fnationfr = rbinomial(1, 0.992) if fnationfr==. & fbirthfr==1
tab fbirthfr fnationfr, missing

//8. IMPUTATIONS FATHER' FAMILY -> OWN BIRTH PLACE AND NATIONALITY
//8.1. GRANDMOTHER FATHER
tab f_gmbirthfr f_gmnationfr

```

After all possible imputations of nationality and birth place missing observations from strongly related variables, we find that, for our restricted sample, we still have 28 father missing values. In all cases, the father did not participated in the survey. Moreover, most of baby's mothers defined themselves as single or divorced not living in couple, except two of them. The ones who declared themselves living in couple, are in charge of the Elfe child, but the father is not present in the household in any case. Finally, the three observations for which we do not know the family status and couple situation, are families in which the father is not in the household and the mother declared that he lives abroad.

La mère vit en couple	Etat matrimonial mère				Total
	Mariée ou	Divorcée	Célibatai	.	
Non	1	5	17	0	23
Oui	1	0	1	0	2

La mère vit en couple	person living with the child, 2 months		Total
	2	4	
Non	21	2	23
Oui	2	0	2
.	3	0	3
Total	26	2	28

#### 4. PARENTS' IMMIGRANT STATUS

To construct the migrant status of parents, we will use nationality and birth place of parents and grandparents. Analyzing all possible combinations between family members, we will be able to know if the individual is first or second generation immigrant. All possible combinations are presented at the end of the document, specifying the considered definition of migrant status.

A last imputation is proposed using grandparents' migrant status to set the partner's status, as previously. We just impute the cases in which the grandmother status is missing but we know the grandfather status is 0 (not "born abroad with foreign nationality"), and vice versa. 1/. and ./1 cases are included as "descendant of at least one immigrant" in parents' migrant status and then, we do not need to impute the missing values.

```
//1. Grandparents
//mother
g m_gmimm = 1 if m_gmbirthfr==0 & m_gmnationfr==0
replace m_gmimm = 0 if m_gmimm==. & !inlist(m_gmbirthfr,.) & !inlist(m_gmnationfr,.)
label var m_gmimm "Grandmother born abroad with foreign nationality (regardless of current residence place), mother"

replace fimm = 4 if !inlist(fbirthfr,.) & !inlist(fnationfr,.)& missing(fimm) //rest of population

```

#### label var fimm "father immigrant history"

```

label define fimm 1 "immigrant father" 2 "father descendant of two immigrants" 3 "father descendant of at least one
immigrant" 4 "rest of population"
tab fimm, missing
tab fimm if months2==1 & f_unknown==0, missing
tab fimm f_gmimm if months2==1 & f_unknown==0, missing
tab fimm f_gfimm if months2==1 & f_unknown==0, missing

tab fimm if months2==1 & f_unknown==0 & !missing(f_gfimm), missing
tab fimm if months2==1 & f_unknown==0, missing

```

We finally have very few missing observations on maternal grandparents status (40 missing values), which would not strongly affect the results of mother's immigrant status. However, parental grandparents migrant status present around 1884 missing observations, which would highly bias the construction of father's immigrant status if we keep these fathers in the analysis. Thus, keeping just parents with full family information after imputation, we have 16527 observations in mother's immigrant status, and 14330 observations in father's immigrant status in our restricted sample (2 months).

#### Mother immigrant status:

mimm	Freq.	Percent	Cum.
1	1,814	10.98	10.98
2	888	5.37	16.35
3	903	5.46	21.81
4	12,922	78.19	100.00
Total	16,527	100.00	

#### Father immigrant status:

father immigrant history	Freq.	Percent	Cum.
1	1,924	13.43	13.43
2	620	4.33	17.75
3	758	5.29	23.04
4	11,028	76.96	100.00
Total	14,330	100.00	

## 5. MULTIVARIATE MULTIPLE IMPUTATION

If you want to continue imputing missing observations, multiple imputations method in STATA could be a solution. In particular, multivariate chained multiple imputation will impute missing values of the variables you need (more than one if necessary), specifying the distribution of the variables to be imputed and using the rest of variables of the data set or analysis (as you wish). This method will compute coefficients of an estimation (imputed variables as dependent variables) using just full observations, and then, it will apply coefficients to get estimations of missing values. The process is repeated till convergence.

```
mi impute chained (logit) var1 var2 = var3 var4 var5, add(15) force
```

- You can have missing values in all imputed, but not in explanatory variables. Otherwise, you should use the option *force*.
- You can define the distribution of the imputed variables.
- Then you can use just the variables you are going to include latter in your model, or all the variables in the data set.
- It is recommended to include the final dependent variable of your latter model as explanatory variable in the imputation.
- If your variable has a lot of missing observations, you must set a higher number of imputations. *add(15)*
- Assumption: Missing at Random observations. It means that missing values are explained by observed variables. The fact that someone did not answer the question depends on observed characteristics.

**However, we should use *mi estimate* to estimate our models when we imputed missing values using multivariate multiple imputations in STATA.**

mi estimate: logit depvar indepvars
